Updated: The Suppressed Report on 1952 U.S.  
Korean War Anthrax Attack

DOCUMENT TEXT Zoom

**APPENDIX AA**

**Report on the Occurrence of Respiratory  
Anthrax and Haemorrhagic Anthrax Meningitis  
following the Intrusion of U.S. Military Planes  
over Northeast China**  
(ISCC/5)

INTRODUCTION

Following the invasions by American airplanes which disseminated insects and other objects (houseflies, anthomyid flies, wolf spiders, ptinid beetles and feathers) carrying anthrax bacilli, there occurred suddenly and successively in some invaded areas of Northeast China a hitherto rare disease—anthrax infection through the respiratory route. The following report concerns the dissemination of insects and other objects carrying anthrax bacilli by American airplanes, the sudden and successive occurrence of anthrax infection through the respiratory route in Northeast China, and finally, discussion and conclusion.

CHAPTER I

Insects and Other Objects Carrying Anthrax Bacilli Dropped by  
American Airplanes

(A) *Feathers*

(1) At 11 a.m. March 11, 1952 when more than four hundred inhabitants of Pei-ching Village, Chang Shan (i.e. the 5th) District of Antung Hsien were holding a meeting, village chief Wu Ching-ming and a farmer Chiang Wen-ch'ang first saw three American planes flying from northwest to southeast. Soon afterwards they observed a greyish object dropped from one of the planes, slowly falling toward southeast. Men and women of the whole village were immediately mobilized to search for that object. A large amount of feathers was found at the Lan-shih-shan region, south east of the village. Two days prior to this, the villagers

## Weaponized agents

Anthrax |  
Botulism |  
Brucellosis |  
Q fever |  
Enterotoxin type B |  
Rice blast |  
Tularemia |  
VEE |  
Wheat stem rust

AHF |  
BHF |  
Bird flu |  
CHIKV |  
Dengue fever |  
EEE |  
Glanders |  
Hantavirus |  
Lassa fever |  
Meloidosis |
