Scientists are always searching for water or oxygen on other planets. Why is it not possible that there might be different then human beings , for instance, who take in sulfuric acid as food
■■■■ ■■■■ ■■ ■■■■ ■■■■■?

Scientists is way behind how let's talk about that

How we calculate time? The way things move around us, our day and night. Do you know that time does not exist. It’s only the scale of measuring movement on earth. Different planets have different time because their movements are different. Hope you have heard that in the universe

there are places where each day/night = 6 months of human on earth but in reality it’s only 1 day/night. Our science is still far behind the truth of universe. Let’s see below facts taken from Hindu Scripture “BHAVISHYA PURAN”

where it is clearly mentioned that life is there on many planets. People of different planets have different capability, power, look and mental level etc. Like Devata (Deity) & Asur (Monster) etc. Time is also different on these planets. the length of time as per Bhavisya
