#CodeTidBit2

Python tip for newbies!

f-strings is an improved way to format strings in Python.

They slice! They dice! They make julienne fries! Okay, they do none of those things, but they do make formatting easier.

#100DaysOfCode #Python

```
1 # String formatting in Python
2
3 name = "Tanmay"
4 age = 22
5
6 # Old school
7 sentence = "My name is %s and I am %s years old." % (name, age)
8
9 # Python 2.6
10 sentence = "My name is {} and I am {} years old".format(name, age)
11
12 # Python 3.6+
13 sentence = f"My name is {name} and I am {age} years old."
```
