**NIH Revises Treatment Guidelines for
Ivermectin for the Treatment of COVID-19
Ivermectin is Now a Therapeutic Option for
Doctors & Prescribers!**

Jan 14, 2021 – One week after Dr. Paul Marik and Dr. Pierre Kory – founding members of the Front Line Covid-19 Critical Care Alliance (FLCCC) – along with Dr. Andrew Hill, researcher and consultant to the World Health Organization (WHO), presented their data before the NIH Treatment Guidelines Panel, the NIH has upgraded their recommendation and now considers Ivermectin an option for use in COVID-19.

Their recommendation has now been upgraded to the same level as those for widely used monoclonal antibodies & convalescent plasma, which is a “neither for nor against” recommendation. The significance of this change is that the NIH has decided to no longer recommend against the use of ivermectin in the treatment of COVID-19 by the nation’s health care providers. A consequence of this change is that ivermectin has now been made a clear therapeutic option for patients.

More to come...
